Yahtzee Game Test Plan

David Wilson

Table of Contents

Project Requirements

The Yahtzee Scorecard program shall read as input five integers representing the results of five rolls of a six-sided die followed by a sixth integer representing the numerical line on the scorecard in which the score is to be filled. It shall then return as output the score for that line calculated per the rules attached to the scoring category. Below is a numbered list of requirements representing each scorecard line to be tested and the calculations for that specific line.

1. For the Aces category, the program shall count the number of 1s in the set of rolls and assign this count as the score. It assigns a score of 0 if the roll contains no 1s.
2. For the Twos category, the program shall count the number of 2s and assign as the score this tally multiplied by 2. It assigns a score of 0 if the roll contains no 2s.
3. For the Threes category, the program shall count the number of 3s and assign as the score this tally multiplied by 3. It assigns a score of 0 if the roll contains no 3s.
4. For the Fours category, the program shall count the number of 4s and assign as the score this tally multiplied by 4. It assigns a score of 0 if the roll contains no 4s.
5. For the Fives category, the program shall count the number of 5s and assign as the score this tally multiplied by 5. It assigns a score of 0 if the roll contains no 5s.
6. For the Sixes category, the program shall count the number of 6s and assign as the score this tally multiplied by 6. It assigns a score of 0 if the roll contains no 6s.
7. For the 3-of-a-kind category, the program checks for three identical die results in the set of rolls. If this is detected, it assigns as the score the sum of all five die rolls. If not, it assigns a score of 0.
8. For the 4-of-a-kind category, the program checks for four identical die results in the set of rolls. If this is detected, it assigns as the score the sum of all five die rolls. If not, it assigns a score of 0.
9. For the Full House category, the program checks the rolls for a subset of three identical numbers and a separate subset of two identical numbers. If this is detected, it assigns a score of 25. If not, it assigns a score of 0. This category scores full points for a 5-of-a-kind.
10. For the Small Straight category, the program checks the rolls for a subset of four consecutive numbers. If this is detected, it assigns a score of 30. If not, it assigns a score of 0.
11. For the Large Straight category, the program checks the rolls for a subset of five consecutive numbers. If this is detected, it assigns a score of 40. If not, it assigns a score of 0.
12. For the Yahtzee category, the program checks the rolls for five identical numbers. If this is detected and the scorecard does not already have a score recorded in the Yahtzee line, it assigns a score of 50. If this is detected and the scorecard does have a score recorded in the Yahtzee line and that score is not 0, it increments the score by 100. If the five identical numbers are not detected, it assigns a score of 0.
13. For the Chance category, the program assigns as the score the sum of all five die results.

When it receives any line of input ending in "14," the scorecard shall calculate the Upper Section Total, adding a bonus of 35 points if this surpasses a threshold of 63 points. Then it shall calculate the Lower Section Total by adding categories 7 through 13. Then it shall calculate the Grand Total by adding the Upper Section Total to the Lower Section Total. It returns these values as an array of Strings.

Test Cases by Function

Test Case Set 01 - Aces

Test Case 01.A
(No Aces)

Input	2, 2, 2, 2, 2, 1
Expected Output	Score: 0
Actual Output	Score: 0
Result	[X] Passed	[] Failed

Test Case 01.B
